## Appendix A. Detailed Methodology

This appendix summarizes the methodology used by MTC and ABAG staff to create the equity analysis measures analyzed for the Draft Plan Bay Area Equity Analysis. The purpose of the equity analysis is to analyze the distribution of benefits and burdens of the draft Preferred Scenario between communities of concern and the remainder of the region using a set of five technical performance measures detailed in this appendix.

The methodology stems from more than a year's worth of work by MTC and ABAG staff, including extensive input from the Equity Working Group and other interested stakeholders, on both the identification of target populations (both low-income households and communities of concern) as well as equity performance measures to be analyzed for the Preferred Scenario and a base year for comparison. Staff is extremely grateful for the time and efforts put forth by Equity Working Group members to improve the equity analysis.

Results for the measures described here are presented in the Draft Equity Analysis Report for Plan Bay Area in Chapter 4, Analysis Results.

## TARGET POPULATI ONS

Conducting an equity analysis requires dividing the regional population into different groups on some demographic or socioeconomic basis, so that comparisons between different groups can be made across the same set of measures (performance measures analyzed are described below under the heading Performance Measures).

## Income-Based Analysis: Low-I ncome Households

Many of the measures analyzed using the regional travel model are able to produce results for all low-income households, or persons living in low-income households, throughout the region, regardless of their residential location. Low-income households are defined in MTC's travel model as having incomes of less than \$30,000 a year 2000 dollars (approximately $\$ 38,000$ in 2010 dollars); non-low-income households as a basis for comparison are defined as having incomes of \$30,000 or more per year in 2000 dollars.

## Geographic-Based Analysis: Communities of Concern

In discussing how to define target populations for equity analysis, Equity Working Group members emphasized the importance of spatial location within the region with respect to the impacts of future development and transportation investments. Thus, staff worked with Working Group members to develop a spatial definition of communities of concern, against which performance measure results could be compared with non-communities of concern (typically referred to in the analysis as the "remainder of region"). Except where noted, data used to define communities of concern is from the 2005-09 American Community Survey, the most recent data set available for this analysis that is readily compatible with MTC's existing travel-analysis-zone definitions used for spatial analysis, which are based on 2000 Census geography.

In response to feedback that the analysis would be more informative with a more focused definition of communities of concern, and a recommendation to consider senior and disabled populations in addition to low-income and minority, staff proposed a revised definition which identifies communities with multiple overlapping potential disadvantage factors relevant to the Plan Bay Area planning process.

Thresholds were proposed to incorporate the most significant concentrations of the various target populations while minimizing inclusion of non-target population members. Concentration thresholds generally fall between the regional average and one standard deviation above the mean. The list of factors, reviewed by the Equity Working Group and approved by MTC's Planning Committee in October 2011, are summarized in Table 1.

Communities of concern are defined as those tracts having concentrations 4 or more factors listed below, or that have concentrations of both low-income and minority populations.

Table 1. Target Populations and Thresholds Used in Overlapping-Factor Analysis.

| Disadvantage Factor <br> Regional <br> Population | Concentration <br> Threshold |  |
| :--- | :---: | :---: |
| 1. Minority Population | $54 \%$ | $70 \%$ |
| 2. Low Income (<200\% of Poverty) Population | $23 \%$ | $30 \%$ |
| 3. Limited English Proficiency Population | $9 \%$ | $20 \%$ |
| 4. Zero-Vehicle Households | $9 \%$ | $10 \%$ |
| 5. Seniors 75 and Over | $6 \%$ | $10 \%$ |
| 6. Population with a Disability | $18 \%$ | $25 \%$ |
| 7. Single-Parent Families | $14 \%$ | $20 \%$ |
| 8. Cost-burdened Renters | $10 \%$ | $15 \%$ |

Source: 2005-09 American Community Survey and 2000 Census (\#6)
A total of 305 out of 1,405 tracts were identified as communities of concern. These locations, shown in Figure 1, were then corresponded to 323 out of the region's 1,454 travel analysis zones for the purpose of extracting and tabulating travel model output on a geographic basis in order to summarize results for communities of concern. Most TAZs in the region correspond to census tract boundaries, except for some locations in the region's densest areas where more than one TAZ may "nest" within a single census tract.

An interactive map showing locations of communities of concern with detailed data as of the 2005-09 American Community Survey timeframe can be found at http:// geocommons.com/maps/ 118675.

An interactive map showing the varying degrees of overlap among the 8 different population concentrations can be found at: http:// geocommons.com/ maps/ 121158.

Descriptions of the potential disadvantage factors contributing to the community-ofconcern definition are provided below. Generally speaking, to define "concentrations" of various populations, thresholds are established at a value between the regional average (mean) share of a tract's total population belonging to a given group, and one standard deviation above the mean, and reflect differences between how different populations are distributed spatially throughout the region. Some populations, such as zero-vehicle households, are highly concentrated in a relatively small number of tracts; other populations, such as seniors over 75+, are much more evenly spread out throughout the region.

Figure 1. Communities of Concern

## Minority Community

A minority community is defined as having $70 \%$ or more residents who are members of any of the following groups defined by the Census Bureau: Black or African-American, Asian, American Indian or Alaska Native, Native Hawaiian or Other Pacific Islander, some other race, two or more races, or Hispanic/ Latino of any race.

## Low-I ncome Community

A low income community is defined as having $30 \%$ or more residents who are identified by the Census Bureau as being below 200\% of the federal poverty level. MTC established the 200\% of poverty threshold in 2001 to account for the Bay Area’s high cost of living; the Census Bureau does not adjust the poverty level for different parts of the continental U.S. with different costs of living to factor into the varying affordability of basic necessities.

The Census Bureau establishes poverty status based on a combination of both household size and income. As of 2010, the 200\% threshold represents a household income of roughly $\$ 22,000$ a year for a single person living alone, and $\$ 44,000$ a year for a family of four. ${ }^{1}$ The definition of a low-income community based on the Census Bureau's characterization of populations in relation to poverty thresholds is distinct from the definition of a lowincome household described under "income-based analysis" above.

## Limited English Proficiency Community

A Limited English Proficiency community is defined as a community where 20\% or more of residents speak English "not well" or "not at all" according to the Census Bureau.

## Zero-Vehicle Households

A concentration of zero-vehicle households is defined as a community where $10 \%$ or more of households do not have access to at least one vehicle according to the Census Bureau.

## Seniors 75+

A concentration of seniors is defined as a community where $10 \%$ or more of residents are age 75 and over according to the Census Bureau. Although area-specific data on driving habits, mobility, and travel independence by specific ages is not available, age 75 was chosen to approximate a point at which seniors' mobility and independence may soon begin or have already begun to diminish relative to that of younger adults.

[^0]
## Persons with Disabilities

A concentration of persons with disabilities is defined as a community where $25 \%$ or more of persons over the age of 5 has one or more disabilities according to the Census Bureau. Because the Census Bureau redefined how questions regarding disability are asked in 2008, data for this definition is from the 2000 Census, the most recent year that disability data is available at the tract level.

## Single-Parent Families

A concentration of single-parent-family households is defined as a community where $20 \%$ or more of family households are headed by a single parent with children present. Inclusion of this group is intended to capture households with unique economic vulnerability, as well as distinct travel needs and patterns from other household types.

## Overburdened Renters

A concentration of overburdened renters is defined as a community where $15 \%$ or more of occupied housing units (including both renters and owners) are occupied by renters paying more than $50 \%$ of their income in rent. This definition is also incorporated into the Displacement Risk equity measure described in the following section on performance measures.

## PERFORMANCE MEASURES

This section describes the methodology used to produce results for each of the performance measures across the different scenarios.

## Housing and Transportation (H+T) Affordability

Housing and Transportation Affordability is expressed as the share of average household income spent on housing and transportation costs. Results for this measure are produced/approximated for low-income households (less than \$30,000 per year in 2000 dollars) vs. non-low-income households (incomes greater than \$30,000 per year in 2000 dollars).

The Affordability metric is expressed as a percentage in terms of

$$
\mathrm{H}+\mathrm{T} \%=\frac{\text { Average household housing costs }+ \text { Average household transportation costs }}{\text { Average household income }}
$$

Generating these estimates relies on a combination of observed, estimated, and forecast values for each of four income levels are shown in Table 2:

Table 2. Sources for H+T Estimates/ Forecasts.

| Variable | Base Year Data Source | Forecast Year Data Source |
| :--- | :--- | :--- |
| Avg. Housing Cost by Income <br> Level | American Community <br> Survey 2005-09 | ABAG Forecasts |
| Avg. Transportation Cost <br> by Income Level | MTC Travel Model | MTC Travel Model |
| Avg. Household Income <br> by Income Level | American Community <br> Survey 2005-09 | ABAG Forecasts |

## Base Year Housing and Income Data

Base Year housing and income data are developed based on the Census Bureau's 2005-09 American Community Survey data on share of income spent on housing. The data for monthly housing costs as a percentage of household income are developed from a distribution of "Selected Monthly Owner Costs as a Percentage of Household Income" for owner-occupied and "Gross Rent as a Percentage of Household Income" for renter-occupied units, which includes any utilities included in rent. The owner-occupied categories are further separated into those with a mortgage and those without a mortgage.
"Household income" reported by the Census Bureau includes both earned income as well as cash benefits received, both public and private, by all household members, but does not include certain other kinds of income, transfers, and non-cash public benefits, including most notably for the purposes of this analysis, in-kind public housing subsidies. All forms of income included and excluded from Census Bureau data are summarized in Table 3. ${ }^{2}$

Table 3. Items Included in and Excluded from Household Incomes Reported by the Census Bureau.

| Included as income | Not included as income |
| :---: | :---: |
| - wage or salary income; <br> - net self-employment income; <br> - interest, dividends, or net rental or royalty income or income from estates and trusts; <br> - Social Security or railroad retirement income; <br> - Supplemental Security Income (SSI); <br> - public assistance or welfare payments; <br> - retirement, survivor, or disability pensions; and all other income. | - capital gains, money received from the sale of property; <br> - the value of income "in kind" from food stamps, public housing subsidies, medical care, employer contributions for individuals, etc.; <br> - withdrawal of bank deposits; money borrowed; <br> - tax refunds; exchange of money between relatives living in the same household; <br> - gifts and lump-sum inheritances, insurance payments, and other types of lump-sum receipts. |

[^1]
## Adjustment for Subsidized Housing

In order to reflect housing affordability in terms of existing housing subsidies not reported to the Census Bureau as either income or housing costs in the analysis, the share of income spent on housing was adjusted to account for the provision of subsidized housing.

According to regional data obtained by ABAG staff, there were 118,229 HUD-funded subsidized units in the region, and an additional 19,491 Section 8 units, for a total of 137,720 subsidized units. Housing costs for these units were assigned to low income households with costs assumed to be fixed at 30\% of household income. The regional average income spent on housing for low-income households of 50\% reported by the ACS data was then applied to the remaining households assumed to be unsubsidized, and an adjusted total calculated by weighting by number of households. For the forecast year, the same approach was applied assuming the same share of low-income housing would remain subsidized at 19\% of housing units, as shown in Table 4. This adjustment resulted in a drop of roughly 4 percentage points in the effective share of income spent on housing by lowincome households as reported in the ACS, from 50\% to 46\% in the base year, and from $49 \%$ to $45 \%$ in the forecast year.

Table 4. Low-Income Subsidized Housing Adjustment for Base and Forecast Years

|  | Base Year |  | Draft Preferred Scenario |  |
| :---: | :---: | :---: | :---: | :---: |
|  | \# Households | \% of Income Spent on Housing | Households | \% of Income Spent on Housing |
| Subsidized (19\%) | 137,720 | 30\% | 179,299 | 30\% |
| Unsubsidized (81\%) | 581,040 | 50\% | 756,461 | 49\% |
| Low Income Total (100\%) | 718,760 | 46\% | 935,760 | 45\% |

Source: MTC/ABAG estimates

## Forecasted Incomes

The analysis translated industry sector-level employment forecasts by county into estimated growth in households in four income groups: very low (less than $50 \%$ of median county household incomes), low income (50-80\%), moderate income (80\% to 120\%), and above moderate income (greater than 120\%). The model linked ABAG's sector-level employment forecasts with occupations and median wages for those occupations. From median wages, household incomes were derived (Table 5). ${ }^{3}$

[^2]Table 5. Employment Growth by Income Category, 2040

| Employment | Very Low <br> Income | Low <br> Income | Moderate <br> Income | Above <br> Moderate <br> Income | Total |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Profess. Bus. Svc | $24 \%$ | $34 \%$ | $14 \%$ | $29 \%$ | $\mathbf{3 6 5 , 6 7 3}$ |
| Health, Education | $16 \%$ | $27 \%$ | $22 \%$ | $35 \%$ | $\mathbf{2 4 4 , 4 8 2}$ |
| Arts, Rec., Other | $87 \%$ | $5 \%$ | $3 \%$ | $4 \%$ | $\mathbf{1 8 5 , 6 8 6}$ |
| Construction | $4 \%$ | $55 \%$ | $27 \%$ | $14 \%$ | $\mathbf{8 0 , 6 9 4}$ |
| Government | $6 \%$ | $11 \%$ | $25 \%$ | $59 \%$ | $\mathbf{7 2 , 5 9 5}$ |
| Retail | $78 \%$ | $6 \%$ | $11 \%$ | $6 \%$ | $\mathbf{5 2 , 3 9 6}$ |
| Finance and Leasing | $0 \%$ | $37 \%$ | $4 \%$ | $60 \%$ | $\mathbf{4 8 , 5 9 6}$ |
| Information | $-4 \%$ | $5 \%$ | $57 \%$ | $42 \%$ | $\mathbf{3 6 , 4 9 7}$ |
| Transport., Utilities | $48 \%$ | $40 \%$ | $4 \%$ | $7 \%$ | $\mathbf{2 8 , 8 9 8}$ |
| Manufact., Whole | $113 \%$ | $-112 \%$ | $-40 \%$ | $139 \%$ | $\mathbf{5 , 7 0 0}$ |
| Agriculture | $106 \%$ | $-32 \%$ | $32 \%$ | $-5 \%$ | $\mathbf{- 1 , 3 0 0}$ |
| Total | $\mathbf{3 2 \%}$ | $\mathbf{2 5 \%}$ | $\mathbf{1 6 \%}$ | $\mathbf{2 8} \%$ | $\mathbf{1 , 1 1 9 , 9 1 8}$ |

Source: ABAG forecasts
This resulted in a slight increase in the share of very low and low income groups while those in the moderate and above moderate categories decreased between 2010 and 2040 (Table 6 ).

Table 6. Total Households by Income Group, 2010 and 2040

|  | Very Low | Low | Moderate | Above <br> Moderate | Total |
| :--- | :---: | :--- | :--- | :---: | :---: | :---: |
| $\mathbf{2 0 1 0}$ | $25 \%$ | $15 \%$ | $18 \%$ | $42 \%$ | $100 \%$ |
| $\mathbf{2 0 4 0}$ | $26 \%$ | $17 \%$ | $17 \%$ | $39 \%$ | $100 \%$ |

## Future Housing Costs

Across the Plan Bay Area EIR alternatives, Alternatives 2, 3 and 4, retain existing housing policies and subsidies and new ones are created that support the development of affordable housing in the region. As a result of the new policies and subsidies, the share of household income spent on housing for Alternatives 2, 3 and 4 remains the same as the base year after assuming that housing cost as a percentage of income follows recent trends ${ }^{4}$ and increases $1 \%$ per decade, or 3\% overall, for low and moderately low income households.

[^3]The estimated, average affordable unit cost for the region is \$350,000 per unit. A key feature of the Alternative 5 land use pattern is that it distributes a high proportion of new housing to "Communities of Opportunity." These jurisdictions provide residents extensive services and highly ranked schools and also have high land costs. The per-unit development cost in these communities is estimated to be significantly higher than the estimated average per unit housing cost for the region. For Alternative 5, it is assumed that a higher subsidy level would provide for double the level of affordable housing produced for low income households, relative to Alternatives 2, 3 and 4.

Table 7. Projected Housing Cost to Income Ratio: Base Year and 2040 EIR Alternatives

| Income Group |  | 1 | 2 | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { Base } \\ & \text { Year } \end{aligned}$ | No Project | Preferred (Draft Plan Bay Area) | Transit Priority Focus | Network of Communities | Environment, Equity \& Jobs |
| Low | 0.46 | 0.49 | 0.46 | 0.46 | 0.46 | 0.42 |
| Moderately Low | 0.37 | 0.40 | 0.37 | 0.37 | 0.37 | 0.37 |
| Moderately High | 0.27 | 0.27 | 0.27 | 0.27 | 0.27 | 0.27 |
| High | 0.20 | 0.20 | 0.20 | 0.20 | 0.20 | 0.20 |
| All households | 0.33 | 0.34 | 0.33 | 0.33 | 0.33 | 0.32 |

## Transportation Costs

A household's estimated transportation costs include fixed costs related to owning automobiles (such as car payments and insurance), and variable costs (such as fuel, parking charges, and/ or transit fares) related to how much and what kind of travel people choose to make day-to-day. Travel costs are forecast as out-of-pocket expenses incurred by travelers on a "typical day" for:

- Bridge tolls
- High Occupancy Toll (HOT) lane prices
- Transit fares
- Auto operating costs, which include assumptions about the price of fuel and fuel economy of vehicles based on modeled vehicle travel
- Parking costs

Out-of-pocket travel costs for a typical day of travel are annualized by multiplying these costs by 300. These annualized costs are then added to a household's annual auto ownership costs (derived from Bureau of Labor Statistics' Consumer Expenditure Survey data by household income level, as shown in Table 8), which vary by scenario as different land use and transportation inputs will result in differing levels of automobile ownership per household.

Table 8. Automobile Ownership Costs per Auto by Income Level (2000 dollars)

| Household Income <br> Category | Annual Automobile <br> Ownership Costs |
| :--- | :--- |
| Less than $\$ 30,000$ | $\$ 2,392$ |
| $\$ 30,000$ to $\$ 60,000$ | $\$ 2,999$ |
| $\$ 60,000$ to $\$ 100,000$ | $\$ 3,347$ |
| More than $\$ 100,000$ | $\$ 4,376$ |

Source: 2009 Bureau of Labor Statistics Consumer Expenditure Survey

## Potential for Displacement

Examining Potential for Displacement ties the proposed new development in the Preferred Scenario to the probability that current residents may be adversely impacted by changes in the housing market. Very low, low, and even moderate income renters may experience displacement if new investment in a neighborhood leads to increased desirability, higher demand for housing and rising rents.

This metric captures the number of households currently considered "over-burdened renters" in relationship to the proposed growth. In a given census tract, if more than $15 \%$ of the housing units are occupied by renters who pay more than $50 \%$ of their income for housing (as characterized in the community of concern definition described in Section .0 above), and the projected household growth in the travel analysis zone (TAZ) corresponding to that tract is more than 30\% above current conditions, the over-burdened households in that area are considered as having potential for displacement.

Thresholds for over-burdened renters are set based on the regional mean and standard deviation from the regional average, identical to the threshold used to define Communities of Concern as described in the preceding section. The 30\% threshold for growth highlights those areas whose percent growth exceeds the regional average for the Preferred Scenario. A higher-than-average percentage of growth is assumed to reflect future market interest in the area, which may yield upward pressure on housing costs. The number of households at risk for displacement includes over-burdened renters in all income categories, since in many
cases moderate-income or even upper income households may move in response to rising rents.

The measure does not predict affordability levels of future housing, nor take into account policies to preserve existing levels of affordability. Bay Area jurisdictions with strong rent protections have still seen large migration shifts in low-income populations. ${ }^{5}$ It is also important to emphasize that while the measure focuses on potential displacement tied to significant increases in development, rising housing costs may also increase displacement pressure where growth has been constrained.

## VMT and Emissions Density

The unit of measurement for this analysis is total VMT per day per sq. km of developed area Where:

- VMT includes vehicular traffic on roadway facilities carrying 10,000 or more vehicles per day
- Per day means a "typical" weekday
- Developed area includes residential, commercial, or industrial land within 1,000 feet of the centerline of roadway facilities carrying 10,000 or more vehicles per day

Calculating this measure relies on identifying affected roadway links as those carrying 10,000 or more vehicles per day, and identifying areas of developed land proximate to these roadway links, to include areas of residential, commercial, or industrial land within 1,000 feet of the centerline of the selected roadway links. This calculation methodology is consistent with the Bay Area Air Quality Management District's (BAAQMD) "Recommended Methods for Screening and Modeling Local Risks and Hazards" (May 2011, version 2.0) as part of their California Environmental Quality Act (CEQA) review guidance for proposed land use projects.

The vehicle-miles of travel (VMT) for each affected roadway link are forecasted using MTC's travel model across different scenarios. This estimate provides the VMT Density measure according to the following formula:

VMT / Developed land area = VMT Density

[^4]Because different scenarios analyzed may capture slightly different subsets of roadway links meeting the threshold of carrying 10,000 or more vehicles per day, analysis across all scenarios (both the base year and the forecast year) will use the same land area captured, defined as the union of all buffers within 1,000 feet of the centerline of any roadway link that carries 10,000 or more vehicles per day in any scenario.

To supplement the more generic measure of VMT density, complementary measures of specific types of emissions are also presented, including coarse particulate matter ( $\mathrm{PM}_{10}$ ), fine particulate matter $\left(\mathrm{PM}_{2.5}\right)$, and particulates from diesel exhaust (diesel PM). Unlike smog-forming pollutants which have regional effects on air quality (and which are analyzed regionally in the Plan Bay Area Environmental Impact Report), each of these forms of emissions can have or are suspected of having localized effects on those exposed to roadways carrying high volumes of vehicles emitting them. Exposure to fine particulate matter and diesel particulates (a specific kind of pollutant known as a toxic air contaminant, or TAC) at sufficient concentrations is believed to increase people's risk of getting cancer or experiencing other serious adverse health effects. ${ }^{6}$

How much of what kinds of pollutants are emitted from on-road vehicles depends on a variety of factors in addition to how many vehicles are traveling on the region's major roadways (measured in vehicle-miles traveled, or VMT): how fast the vehicle is traveling (either in terms of free-flowing average speeds or based on the effects of congestion), whether the vehicle's engine is warmed up, the vehicle's fuel economy and weight class, and the type of engine fuel used. In addition, brake and tire wear are included as on-road mobile sources of $\mathrm{PM}_{10}$ and $\mathrm{PM}_{2.5}$ in this analysis.

To approximate the potential of risk from exposure to $\mathrm{PM}_{10}, \mathrm{PM}_{2.5}$, and diesel particulates, from on-road mobile sources, this analysis uses a localized emissions inventory as a proxy for exposure risk. ${ }^{7}$ MTC uses a California-specific transportation emission-factor analysis tool, EMFAC2011, to model these emissions based on estimated VMT and vehicle speeds in each planning alternative. Vehicle travel and associated emissions are assigned either to

[^5]communities of concern or the remainder of the region, depending on where the travel takes place on the region's network of freeways, expressways, and major arterials.

## Commute Time

This measure provides average travel time per trip for commute trips by all modes, based on the location of a worker's residence and place of work.

Commute travel time is analyzed separately because travel time between home and work generally provides an indication of the proximity of jobs and housing for different socioeconomic groups.

Factors that go into estimating travel time are similar for both commute trips as well as non-mandatory tours (which are described in the following section). Across all kinds of trips, decisions about how, where, and when to travel are complex; MTC's travel model attempts to represent some of this complex behavior by operating on a synthetic population that includes representative households and persons for each actual household and person in the nine-county Bay Area - both in the base year and in forecast years. Travelers move through a space that is segmented into "travel analysis zones." ${ }^{8}$ A series of travel-related choices are simulated for each household and person within each household; these choices are simulated in the following sequence:

- Usual workplace and school location - Each worker, student, and working student in the synthetic population selects a travel analysis zone in which to work or attend school (or one zone to work and another to attend school);
- Household automobile ownership - Each household, given the household location and demographics as well as each members' work and/ or school locations, decides how many vehicles to own;
- Daily activity pattern - Each household determines, together, the daily activity pattern of each household member, the choices being mandatory (go to work or school), non-mandatory (leave the house, but not for work or school), or stay at home.
- Work/ school tour frequency and scheduling - Each worker, student, and working student decides how many round-trips they will make to work and/ or school, and then schedules a time to leave home for work and/ or school as well as a time to return home;

[^6]- J oint non-mandatory tour frequency, party size, participation, destination, and scheduling - Each household determines the number and type (e.g. to eat, to visit friends, etc.) of "joint" (i.e. two or more members of the same household traveling together) non-mandatory (i.e. not work or school) round trips in which to engage, then determines which members of the household will participate, where and at what time the tour (i.e. the time leaving home and the time returning home) will occur;
- Non-mandatory tour frequency, destination, and scheduling - Each person determines the number and type of non-mandatory (e.g. to eat, to visit friends, to shop, etc.) round trips to engage in during the model day, where to engage in them, and at what time to leave and return home;
- Tour travel mode - The tour-level travel mode choice (e.g. drive alone, walk, take transit, etc.) decision is simulated separately for each tour and represents the best ${ }^{9}$ mode of travel for the round trip (a "tour" is a round trip from either home or the workplace);
- Stop frequency and location - Each traveler or group of travelers decide whether to make a stop on an outbound (from home) or inbound (to home) leg of a travel tour, and if a stop is to be made, where the stop is made, all given the round trip tour mode;
- Trip travel mode - A trip is a portion of a tour, either from the tour origin to a stop, a stop to another stop, or a stop to a tour destination, and a separate mode choice decision is made for each trip, doing so with awareness of the prior tour mode choice decision;
- Assignment - Vehicle trips for each synthetic traveler are aggregated to build time-of-day-specific matrices (i.e. tables of trips segmented by origin and destination) that are assigned via the standard static user-equilibrium procedures to the highway network (i.e. each vehicle is assigned to his or her shortest cost - both monetary and non-monetary - path between the origin and destination); transit trips are assigned to time-of-day-specific transit networks.

## Non-Commute Travel Time

This measure provides average travel time per trip for non-mandatory tours by all modes. Non-commute trips are analyzed because:

- Commute travel to work is analyzed separately as a measure of jobs-housing fit.

[^7]- Low-income travelers are more likely than higher-income travelers to be nonworkers, students, or retirees, who have distinct trip-making patterns. ${ }^{10}$
- Non-commute trips outnumber commute trips for low-income travelers ${ }^{11}$ (though commute trips are generally longer than non-commute trips in terms of time and distance). Non-commute trips are also more likely to occur at off-peak travel times.
- Non-commute trips capture a wider variety of travel purposes including shopping, accessing health care and social services, and social and recreational trips, and as such provide a better indication of whether residents live in "complete communities" where a wide variety of daily needs are located nearby.

Results of this measure in average number of minutes per trip are produced for

- Communities of concern and the remainder of the region (all residents of each)
- Low-income travelers vs. non-low-income travelers, regardless of community of residence.
"Non-commute" travel defined for the purposes of this analysis includes travel not associated with a tour involving work or school. For example, going to the grocery store and back home would be included in this definition. These "non-mandatory" tour purposes include such activities as shopping, recreational trips, visiting, escorting others, eating out, and "other" trips.

This measure provides average travel time per trip for commute trips by all modes, based on
Results of this measure in average number of minutes per trip are produced for:

- Communities of concern and the remainder of the region (all residents of each)
- Low-income travelers vs. non-low-income travelers, regardless of community of residence.

Details regarding how travel decisions are made for all kinds of trips, including commute trips, are described above under "Commute Time."

[^8]

This page left blank intentionally.

Table B-1. Detailed Demographic and Socioeconomic Profile of Communities of Concern and Remainder of Counties: 2005-09

Note: Values in boldface indicate the share of population/households exceeds the established regional threshold.
 individual tract within each aggregated community of concern nevertheless meets the definition of having either 4 or more concentration factors or else having concentrations of both minority and low-income populations.

Source: American Community Survey 2006-2010 5-year estimates, Tables B08122B, B08122C, B08122D, B08122E, B08122F, B08122G, B08122H, B08122I.
Note: "Amer. Ind." includes American Indians and Alaska Natives. "Pac. Islander" includes Native Hawaiians and Pacific Islanders. "Other/Multiple" includes respondents reporting "Some
Other Race" or "Two or More Races." Totals do not sum to the universe of workers because some respondents are included in multiple categories. Totals for Black/African-American,
American Indian/Alaska Native, Asian, and Native Hawaiian/Pacific /slander include both Hispanic/Latinoand non-Hispanic/Latino respondents. Hispanic/Latino includes respondents from all racial groups.

    ${ }^{7}$ Typically, exposure risk is estimated from a variety of factors including total emissions inventory (onroad mobile, other mobile, and stationary sources), distance from source, prevailing wind direction, and other socioeconomic and demographic risk factors. The Bay Area Air Quality Management District, through its Community Air Risk Evaluation (CARE) Program, evaluates localized exposure risks to air toxics based on air quality models that more accurately predict the location and extent of concentrations, but these models do not produce estimates for the Plan Bay Area forecast year of 2040. For more information on the CARE Program, see http:// www.baaqmd.gov/ CARE/index.htm.
